

Questions

1. What methods would a class that implements the `java.lang.CharSequence` interface have to implement?

A class implementing `java.lang.CharSequence` must implement these **4 methods**:

```
1  int length();
2  char charAt(int index);
3  CharSequence subSequence(int start, int end);
4  String toString();
```

2. What is wrong with the following interface?

```
1  public interface SomethingIsWrong {
2      void aMethod(int aValue){
3          System.out.println("Hi Mom");
4      }
5  }
```

The problem with the interface mentioned is that interface methods cannot have a body unless they are marked default or static.

3. Fix the interface in question 2.

```
1  public interface SomethingIsWrong {
2      void aMethod(int aValue);
3  }
```

Changed into abstract

4. Is the following interface valid?

```
1  public interface Marker {
2  }
```

Yes, the following interface is valid. Because this is called a marker interface (used to “mark” a class).
